Overview

Can aviation really become less polluting?

The electrification of airport energy system as a micro-grid is a promising solution to achieve zero emission airport operation, however such electrification approach.

What is the energy system of Airport outside the terminal?

The energy system of airport outside the terminal is designed as a direct current (DC) microgrid system. The aircraft APU and EVs in the airport are integrated into the DC microgrid. The integration of HES has established an energy link between the DC microgrid system and the aircraft energy supply at remote stands.

Why do airports need photovoltaic power generation?

The large area of the airport including airport terminal roof, car park and other open land space are ideal for the development of photovoltaic (PV) power generation, which can provide the clean and self-sufficient airport energy supply.

Why are airport energy systems so expensive compared to other microgrid designs?

Due to the high upfront investment costs of the hydrogen energy system, the airport energy system integrated with hydrogen production and storage facilities has high initial cumulative costs comparing with other microgrid designs.

How can airport energy system meet 'supply-demand' balance?

In order to satisfy the “supply-demand” balance of airport energy system, traditional methods of capacity expansion of upstream power grid are less feasible due to high capital investment costs, land and resource restrictions, and long construction cycle .
