

Distributed energy storage applications in cuba

Overview

What types of energy systems are covered in Cuba?

Coverage includes generation and storage systems, renewable energy installations (hydropower, solar PV, wind, biomass, ocean, and solar thermal), electrical grid history and characteristics, and an analysis of Cuba's electrical energy resiliency.

How can solar and wind power improve energy security in Cuba?

Every time solar and wind capacity is progressively increased, Cuban authorities will save on fuel costs and achieve environmental improvements and energy security. The money saved could be gradually reinvested in new solar and wind power installations.

What is the energy consumption column in Cuba?

Electricity production of Cuba in 2015 sorted by technologies and resources, the energy consumption column corresponds to the primary resources needed to produce the amount of electricity in the column called electricity production with the current Cuban energy system. Thermoelectric power plants have an installed capacity of 2.59 GW.

Is Cuba a vulnerable energy system?

Cuba is currently in a vulnerable energy situation since it strongly depends on the importation of fossil energy. Strategies based on intermittent RES (solar and wind) can reduce this vulnerability, but the introduction of this type of source impacts the energy system's characteristics and aspects at a country/regional scale.
