

# Generator cabinet set parameters

## Overview

---

How do I choose a generator set?

The first step in sizing and selecting a generator set is to establish project parameters. Minimum generator set load/capacity: Running a generator set under light load can lead to engine damage, reducing reliability. Cummins Power Generation does not recommend running generator sets at less than 30 percent of rated load.

What are the parameters of a generator?

Frequency - The frequency must be equal to the system frequency. Phase Sequence - The phase sequence of both the generator and the system must be identical. Phase Angle - The phase angle difference should be near zero. Manual Synchronization - Operators manually adjust parameters before closing the circuit breaker.

What factors affect generator set size?

Many factors influence generator set sizing, making it time consuming to manually calculate required generator capacity. Parameters that determine the required generator set size include minimum generator set load; maximum allowable step voltage dip and step frequency dip; altitude and temperature; duty cycle, fuel, phase, frequency and voltage.

How do I sizing a generator set?

The next and most important step in sizing a generator set is to identify every type and size of load the generator set will power. In general, when non-linear loads are present, it may be necessary to oversize the alternator. Following is a general discussion of how various loads and electrical factors affect the sizing of generator sets.
