

# Portable power charging time

## Overview

---

What is battery charge time?

Battery charge time refers to the total time required to fully restore the battery's capacity after it has been discharged. The time can vary significantly depending on the battery type, battery size, Battery Management System, and the charging method. How to Calculate Battery Charging Time?

How do you calculate the charge time of a Jackery portable power station?

Formula: Charge Time = (Battery Capacity × Depth of Discharge) ÷ (Charge Current × Charge Efficiency). Jackery Portable Power Stations are portable battery backups that can be carried anywhere to power indoor or outdoor appliances. These can be recharged in just a few hours using solar panels, car chargers, and wall outlets.

How to calculate battery charge time using a 12V battery calculator?

Example: Let's calculate the charging time of a lithium-ion battery having 3000mAh, 24W charging rate, 12V voltage, and 90% charging efficiency using a 12V battery charge time calculator. First, you'll need to convert the charging current (24W) into amps. Amps =  $24W \div 12V = 2A$  Similarly, convert the battery capacity from mAh to Ah.

How do you calculate charge time?

Charge Time = (Battery Capacity × Depth of Discharge) ÷ (Charge Current × Charge Efficiency) Example: Let's say you want to calculate the charge time of a 100Ah lead acid battery with a 50% DoD. The charging efficiency of the lead acid battery with a 10A charging current is 80%.
