

Simple wind power generation system

Overview

The key feature of a small wind energy system is the wind turbine. The turbine uses the energy of motion (kinetic energy) from the wind to turn a shaft, thus making mechanical energy. This shaft is attached to a generator. The resulting spin within the generator makes electricity.

DIY wind turbines can provide renewable electricity for off-grid homes, cabins, and homesteads, especially in consistently windy areas. Building your own turbine can be far more affordable than buying a commercial system, using readily available materials and basic mechanical skills. Small wind.

A residential wind turbine converts moving air into electricity for your home. Unlike those massive utility-scale giants you see on wind farms, home wind turbines are designed for individual properties and typically generate between 400 watts and 100 kilowatts of power. The concept is elegantly.
