

What is the voltage of a string of 7 lithium batteries

Overview

What voltage is a lithium ion battery?

A battery at 3.7V is about 50% charged. For full charge, the voltage should reach 4.2V. At what voltage is a lithium-ion battery considered dead?

When a lithium-ion battery drops to around 3.0V or below, it is considered fully discharged or “dead.” Prolonged use below this point can cause permanent damage.

What is the relationship between voltage and charge in a lithium-ion battery?

The relationship between voltage and charge is at the heart of lithium-ion battery operation. As the battery discharges, its voltage gradually decreases. This voltage can tell us a lot about the battery’s state of charge (SoC) – how much energy is left in the battery. Here’s a simplified SoC chart for a typical lithium-ion battery:.

What does 3.7V mean on a battery?

What this means is that the maximum voltage of the cell is 4.2v and that the “nominal” (average) voltage is 3.7V. As the battery is used, the voltage will drop lower and lower until the minimum which is around 3.0V. You should see the number 3.7V written on the battery itself somewhere.

Is a 3.7V battery fully charged?

No. 3.7V is the nominal (average) voltage, not the fully charged state. A battery at 3.7V is about 50% charged. For full charge, the voltage should reach 4.2V. At what voltage is a lithium-ion battery considered dead?

When a lithium-ion battery drops to around 3.0V or below, it is considered fully discharged or “dead.”
