ZIBs are an alternative to lithium-ion batteries for grid-scale energy storage because of their affordability, safety, and compatibility with aqueous electrolytes. Research challenges at the anode, electrolyte, and cathode currently prevent its further commercialization. [11].

ZIBs are an alternative to lithium-ion batteries for grid-scale energy storage because of their affordability, safety, and compatibility with aqueous electrolytes. Research challenges at the anode, electrolyte, and cathode currently prevent its further commercialization. [11].

Aqueous zinc-ion batteries (AZIBs) are attractive for large-scale energy storage due to their intrinsic safety, low cost, and environmental compatibility. However, the high charge-to-radius ( $q/r$ ) ratio of  $Zn^{2+}$  leads to strong solvation and sluggish solid-state diffusion, which hinder efficient.

Aqueous zinc-iodine batteries (AZIBs) offer intrinsic safety, low cost, and high theoretical capacity, yet their practical performance is hindered by three coupled challenges: polyiodide shuttling that depletes active material and reduces coulombic efficiency; sluggish  $I_2/I^-$  (  $\text{I}^-$  )\_.

zinc-ion battery (ZIB) has the potential as an alternative to lithium-ion batteries (LIBs) in energy storage applications. ZIBs have multiple advantages, such as safety, environmental friendliness, low cost, and natural abundance, that could be a potential alternative to LIBs. This mini-review summarizes the basics of aqueous.

A zinc-ion battery or Zn-ion battery (abbreviated as ZIB) uses zinc ions ( $Zn^{2+}$ ) as the charge carriers. [1] Specifically, ZIBs utilize Zn metal as the anode, Zn-intercalating materials as the cathode, and a Zn-containing electrolyte. Generally, the term zinc-ion battery is reserved for.
